

- deep convnet \rightarrow gradient vanishing when back prop
- Residual Networks

Natural Language Processing:

- Glove Word representation:
- Word Net
 - one-hot vectors
 - vector size fixed
 - sparsity
 - no natural notion of similarity.

word-embedding matrix?

PPMI matrix \rightarrow very sparse.

for sparsity ϵ do SVD

minimize $\| M^{PPMI} - UV^T \|_F^2$

$W \cdot V$ $W \times d$ $W \times r$ $d \times r$

for binous element-wise summation

\rightarrow redundant info within the sparse matrix.

SVD: compression

word2vec

on page 25

difference between two group of words,
if similar relations,
vector looks similar

problem: Bank of China v. river bank

\rightarrow solution: contextual word embedding.

mission: text classification.

ARV \rightarrow simplified
of
LSTM
