$$\dot{x} = Ax$$

Nearly degenerate systems $A \dots$

... e-vects of A are nearly parallel

$$A = \begin{bmatrix} -0.001 & 1 \\ 0 & -0.01 \end{bmatrix}$$

$$\left. \begin{aligned} \lambda_1 &= -0.01 \\ \lambda_2 &= -0.001 \end{aligned} \right\} \text{stable}$$

$$z_1: [A - \lambda_1 I] z_1 = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0.001 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$z_1 = \begin{bmatrix} 1 \\ -0.001 \end{bmatrix}$$

$$z_2: [A - \lambda_2 I] z_2 = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 \\ 0 & -0.001 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$z_2 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

grow first in a transient fashion
then damped it out.

$$\dot{x} = Ax \quad A = \begin{bmatrix} \lambda & 1 \\ 0 & \lambda \end{bmatrix} \text{ when stable } \lambda \quad \text{Jordan canonical form}$$

$$x(t) = e^{At} x(0)$$

$$A = \underbrace{\begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix}}_S + \underbrace{\begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}}_T$$

$$ST = \begin{bmatrix} 0 & \lambda \\ 0 & 0 \end{bmatrix}$$

$$TS = \begin{bmatrix} 0 & \lambda \\ 0 & 0 \end{bmatrix}$$

$$ST = TS$$

$$e^{S+T} = e^S e^T$$

$$e^{S+T} \neq e^S e^T \quad \text{generally}$$

yet

$$e^{S+T} = e^S e^T$$

$$\text{if } ST = TS$$

$$\begin{aligned} \therefore e^{At} &= e^{S t} e^{T t} \quad e^{T t} = I + T t + \frac{1}{2!} T^2 t^2 + \dots = I + \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} t = \begin{bmatrix} 1 & t \\ 0 & 1 \end{bmatrix} \quad \left(\begin{array}{l} \text{proof it via} \\ (S+T)^n = \sum_{j+k=n} \frac{S^j T^k}{j!k!} \end{array} \right) \\ &= \begin{bmatrix} e^{\lambda t} & 0 \\ 0 & e^{\lambda t} \end{bmatrix} \begin{bmatrix} 1 & t \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} e^{\lambda t} & t e^{\lambda t} \\ 0 & e^{\lambda t} \end{bmatrix} \quad \begin{array}{l} \text{new term} \\ \text{secular term} \end{array} \end{aligned}$$

$$A = \begin{bmatrix} \lambda & 1 & 0 \\ 0 & \lambda & 1 \\ 0 & 0 & \lambda \end{bmatrix} \rightarrow e^{At} = \begin{bmatrix} e^{\lambda t} & te^{\lambda t} & \frac{1}{2}t^2 e^{\lambda t} \\ 0 & e^{\lambda t} & te^{\lambda t} \\ 0 & 0 & e^{\lambda t} \end{bmatrix}$$

A tale of two "A" matrices:

$$A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \begin{matrix} \lambda_1 = 1 \\ \lambda_2 = 1 \end{matrix}$$

$$e^{At} = \begin{bmatrix} e^t & 0 \\ 0 & e^t \end{bmatrix}$$

$$[A - \lambda I] \xi = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\xi_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$\xi_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

look @ the

$$\text{rank}(A - \lambda I) = 0$$

$$A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \quad \begin{matrix} \lambda_1 = 1 \\ \lambda_2 = 1 \end{matrix}$$

$$e^{At} = \begin{bmatrix} e^t & te^t \\ 0 & e^t \end{bmatrix}$$

$$[A - \lambda I] \xi = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\xi_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

look @ the

$$\text{rank}(A - \lambda I) = 1$$

to find
more

generalized e-vectors

$$[A - \lambda I]^2 \xi_2 = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ is non-normal

$$A^T A \neq A A^T$$
